KEYMACRO is a script that allows users to use the Windows Scripting Host (WSH) to launch macros from another application. Its purpose is to make it possible for applications such as Notepad++ to launch macros when the user clicks on a specific button (e.g. a button located on a toolbar). After installing it, users are able to do the following: 1- Launch a file by double-clicking on it; 2- Open a specific file from Explorer by selecting its location; 3- Open a specific file by using Explorer's 'Go To' functionality. Furthermore, users can also launch specific pages (e.g. MyWebsite) from their browser.

How To Install/Uninstall KEYMACRO: As a script, it is typically installed with the applications it is compatible with, which is the default. In some situations though, users might decide to install the script as a stand-alone application, which is done by right-clicking on the script in the 'Add/Remove Programs' window, then selecting 'Change/Remove'. **Important:** If you are using KEYMACRO with notepad++, make sure the 'Always open files and programs from this program' setting is disabled in the Options menu. If you use any other text editor, make sure the same setting is disabled.

Microsoft Office Access Runtime is a 64-bit application that was specifically developed to help developers create and distribute Microsoft Access based apps. However, this runtime is far more than just a simple piece of software, as it actually brings to the table some useful features that are being actively sought after by developers. In other words, Microsoft Office Access Runtime allows users to create and run Access apps without having to install Microsoft Access and its necessary components. Rather, a developer simply has to create an Access-based app, which is then deployed and made available to end-users as a stand-alone app. On top of this, the installation process is fully automated, as it comes with a wizard that will guide the user through all the steps required to create and deploy the app. Furthermore, even though it is also possible to manually deploy the app, this is discouraged, as it will not only significantly slow down the installation process, but it will also be easier to accidentally install something other than Microsoft Office Access Runtime. All in all, in addition to providing a native way to create and distribute Access-based apps, Microsoft Office Access Runtime also comes with several useful features that developers and end-users can utilize to their advantage.

The tool can be installed on both 32-bit and 64-bit Windows editions. However, it is only capable of working with Windows 2000, Windows XP and Windows Vista operating systems. Furthermore, the runtime is only compatible with Access 2010 and newer editions. In other words, it will not be able to create and deploy apps based on Access 97, 2000, 2003 or 2007. As a result, users will have to rely on different tools in order to be able to create and distribute apps based on Microsoft Access 97, 2000, 2003 or 2007. However, all the aforementioned editions will be able to work with third-party apps that were designed to work with Microsoft Access 2010 and newer. In other words, end-users will not be required to install and use Microsoft Office Access 2010 in order to be able to run a particular app. This is particularly useful in case a user wants to
